

JBL PROCLEAN AQUA IN-OUT water jet pump

Suction pump for convenient water changes in aquariums

- The pump, which is screwed to the tap, creates suction from the flowing tap water so that water can be drawn out of the aquarium through a hose. After moving a lever, it can be filled again
- Screw the water jet pump onto the water tap, connect the hose, open the water tap and move the lever position to select whether water is to be siphoned off or refilled
- The water jet pump is an element of the JBL PROCLEAN AQUA IN-OUT water changing set, but can also be purchased separately
- The water jet pump has a 3/4" threaded connection. It needs to be attached to the tap thread (mostly M28x1; M22x1; M24x1) by means of an adapter (not included)
- Package contents: 1 complete water jet pump (3/4" connection) with stopcock incl. seal ring, movable hose connection (12/16) with hose locking nut

JBL PROCLEAN AQUA IN-OUT water jet pump

Product information

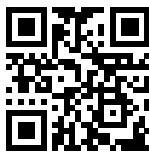

Easy to install

Connect the water jet pump to the water tap. Connect the long hose to the water jet pump and the other end to the gravel cleaner. Hang the gravel cleaner inside the aquarium. Set the stopcock on the water jet pump to flow. Completely turn on the tap. The aquarium water will be sucked in by the water flowing past. While the water is being sucked in, clean the bottom of the aquarium with the gravel cleaner. To refill the aquarium, close the stopcock on the water jet pump and let fresh water flow into the aquarium.

The water jet pump is a component of the water changing set JBL PROCLEAN AQUA IN-OUT, but can also be purchased separately. It then needs to be attached to the tap thread using a thread adapter (not included). Next a hose (12/16) is needed which leads from the water jet pump to the aquarium and a gravel cleaner (substrate cleaner) is attached to its end.

Regular partial water change

Food remains, plant remains and other metabolic products pollute the aquarium water. Since aquarium filters can't completely remove these substances from the water and a large part of the waste enters the aquarium bottom, a regular partial water change (about 1/3 of the water content) needs to be carried out every 2 weeks. Always siphon off the waste from the substrate when carrying out a partial water change. After the partial water change a good water conditioner such as JBL Biotopol is vital to prepare the new tap water for fish.
