## Product information

### Healthy fish

An air pump for aquariums is an advantage during the night since plants need light to produce oxygen. In thinly planted aquariums the air pump supplies the necessary water circulation. In aquariums with dense planting the air pump provides the aquarium with oxygen at night, since the number of plants means the oxygen concentration can drop to a dangerous level. When disease is present in the aquarium the air pump increases the oxygen level in the water, an essential condition for many medications.

### Precise air regulation

The ProSilent Control has 1 inlet with 2 air outlets. This makes it possible to run several air-driven features for the aquarium at the same time. Both air outlets can be individually adjusted, are threaded and self-locking. Can be extended with an additional double valve.
