

# JBL Test Combi Set Marin

Starter test case for marine aquariums

Suitable for:

- 6 water tests to easily and precisely determine the most important water values in marine water, especially for fish aquariums
- Add colour indicator and compare on colour chart or count the drops until the colour changes
- Contains tests for carbonate hardness, pH value, ammonium/ammonia, nitrite, nitrate and phosphate
- Comparator system facilitates the colour comparison and takes the inherent water colouring into account
- Contents: 6 water tests, comparator block, 3 cuvettes, syringe, measuring spoon, colour charts, analysis record sheets and instructions

## Product information

Having set up your marine aquarium the water values need to be measured between daily and weekly, to find out how well the aquarium is developing and when it is ready for the animals to be added. The carbonate hardness indicates the pH stability of the water. It should be between 7 and 10 °dKH. Ammonium is the first stage of the nitrogen decomposition and it increasingly changes into toxic ammonia with pH values above 7. The ammonium content must not exceed 0.25 mg/l. The nitrite value indicates whether this toxic compound for fish is present in the aquarium. Nitrite should always have a level below 0.2 mg/l. Nitrate and phosphate serve as food for algae. Nitrate values over 20 mg/l and phosphate values over 0.1 mg/l can lead to excessive algae growth. Many coral species grow significantly better with low nitrate and phosphate amounts since endosymbiotic algae (zooanthellae) live in their tissues.

You can analyse your measured water values in the JBL Online Laboratory free of charge and receive recommendations.
