

JBL NitratEX

Filter material for the rapid removal of nitrate (NO3)

Suitable for:

- Prevents and eliminates unwanted algae: filter mass for use in aquarium filters or for tap water for rapid nitrate removal
- Use: fill filter mass into universal filter bag and place in the filter: 250 ml (170 g) bind 9000 mg nitrate
- If the nitrate level in the water rises again, this filter material can be regenerated with common salt and thus made usable again
- Only for freshwater aquariums and for rapid nitrate removal from the source water (e.g. tap water)
- Package contents: 250 ml regenerable filter material, incl. net bag, clip for approx. 200 litres

JBL NitratEX Product information

Filter materials serve multiple purposes: they either filter suspended matter out of the water (mechanical filtering), provide settlement space for bacteria that break down pollutants (biological

filtering), or remove harmful substances from the water (chemical/absorptive filter materials). Of course, mechanical filter media eventually become biological filter materials. The filter material should always be fitted from coarse to fine inside the filter, as fine filter material clogs too quickly at the beginning. A coarse filter sponge or filter ceramic (JBL Cermec) is ideal for the first filter stage. For biological filtering, JBL Sintomec and JBL Micromec provide the largest possible surface area for pollutant degrading bectering. area for pollutant-degrading bacteria. Activated carbon (JBL Carbomec active and Carbomec ultra) filters out discolouration and medication residues. JBL NitratEx and JBL BioNitrat Ex filter out nitrates. JBL PhosEx Ultra helps against algae-promoting phosphate. Silicat Ex helps against silicic acid which promotes diatoms.

2 Alternatives for nitrate removal:

JBL NitratEx: This is an exchange resin which extracts algae-promoting nitrate (NO3) from the water and replaces it with harmless chloride. This is done quickly and in direct current without any waiting time. In this way nitrate can also be removed from tap water before it enters the aquarium.

JBL BioNitratEx: Is a biological filter material on which bacteria settle after a little waiting time and then biodegrade nitrate without any "side effects". For efficient nitrate decomposition the bacteria need a carbon source (food) which is contained in the filter material. Thus the JBL BioNitratEX balls become smaller over time until they are completely degraded. Only then do they have to be renewed.
