Product information

Ideal nutrition for plants

The right CO2 concentration in the water is of great importance for the aquarium plants. Carbon dioxide is the main nutrient for plants and promotes their growth. Plants use the CO2 for the photosynthesis and thus supply the water with essential oxygen. They prevent algae growth, remove pollutants, provide hiding places and reduce pathogens.

Economical and direct

This practical JBL CO2 direct diffuser saves a diffuser in the aquarium, a bubble counter and a check valve. It even saves 20 % CO2 thanks to its ingenious functioning.

Easy to install

The ProFlora Direct Membrane ensures the finest atomization of the CO2 in the diffuser and can be replaced with just a few single steps in the JBL ProFlora direct.
